(a) routing edits cost bits
Pinsker lower bound (Thm. 1d)
theory $A = \sum_v \nu_S(v) D_v$
measured, arithmetic coder (200 walks, ±1 SD)
extra bits per walk
routing-edit strength
(b) detected vs. silent (Prop. 1)
lines: theory; hollow markers: simulation
topological edit: detected
label edit: silent error
probability per message
fraction of edited nodes / labels
